Data-Driven Classifiers Linear Regression

#### Overview

#### Linear Regression

**Problem 1:** Show that the  $\beta$  that minimizes  $RSS(\beta)$  is  $\beta = (X^TX)^{-1}X^Ty$ .

To prove the previous statement, we will multiply the polynomial out, and find where the derivative equals zero to find the minimized  $\beta$ .

$$(\boldsymbol{y} - \boldsymbol{X}\beta)^T (\boldsymbol{y} - \boldsymbol{X}\beta) = \boldsymbol{y}^T \boldsymbol{y} - \boldsymbol{y}^T \boldsymbol{X}\beta - \boldsymbol{X}^T \beta^T \boldsymbol{y} + \boldsymbol{X}^T \beta^T \boldsymbol{X}\beta$$
$$= \boldsymbol{X}^T \beta^T \boldsymbol{X}\beta - 2 \boldsymbol{X}^T \beta^T \boldsymbol{y} + \boldsymbol{y}^T \boldsymbol{y}$$

To find the minimized  $\beta$  we will now take the derivative and solve for  $\beta$  at zero.

$$\frac{d}{d\beta} \mathbf{X}^T \beta^T \mathbf{X} \beta - 2 \mathbf{X}^T \beta^T \mathbf{y} + \mathbf{y}^T \mathbf{y} = 0$$

$$2 \mathbf{X}^T \mathbf{X} \beta - 2 \mathbf{X}^T \mathbf{y} = 0$$

$$\mathbf{X}^T \mathbf{X} \beta = \mathbf{X}^T \mathbf{y}$$

$$\beta = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$
(1)

**Problem 2:** Show that if the norm of  $\|Y - X\hat{B}\|^2$  is the Frobenius norm, then that the  $\hat{B}$  minimizing the same is determined by  $\hat{B} = (X^T X)^{-1} X^T Y$ 

Given that the Frobenius Norm for real numbers is:

$$\sqrt{Tr(\pmb{A}\pmb{A}^T)}$$

Then the Frobenius Norm of the problem statement is:

$$\sqrt{Tr(\boldsymbol{Y} - \boldsymbol{X}\hat{\boldsymbol{B}})(\boldsymbol{Y} - \boldsymbol{X}\hat{\boldsymbol{B}})^T} = \sqrt{Tr(\boldsymbol{X}^T\hat{\boldsymbol{B}}^T\boldsymbol{X}\hat{\boldsymbol{B}} - 2\boldsymbol{X}^T\hat{\boldsymbol{B}}^T\boldsymbol{Y} + \boldsymbol{Y}^T\boldsymbol{Y})}$$

To find the  $\hat{B}$  minimizing the problem statement, we will take the deriving with respect to  $\hat{B}$ 

$$\frac{d}{d\hat{\boldsymbol{B}}} \sqrt{Tr(\boldsymbol{X}^T \hat{\boldsymbol{B}}^T \boldsymbol{X} \hat{\boldsymbol{B}} - 2\boldsymbol{X}^T \hat{\boldsymbol{B}}^T \boldsymbol{Y} + \boldsymbol{Y}^T \boldsymbol{Y})}^2 = 0$$
$$2\boldsymbol{X}^T \boldsymbol{X} \hat{\boldsymbol{B}} - 2\boldsymbol{X}^T \boldsymbol{Y} = 0$$
$$\boldsymbol{X}^T \boldsymbol{X} \hat{\boldsymbol{B}} = \boldsymbol{X}^T \boldsymbol{Y}$$

$$\hat{\boldsymbol{B}} = (\boldsymbol{X}^T \boldsymbol{X})^{-1} \boldsymbol{X}^T \boldsymbol{Y} \tag{2}$$

Data-Driven Classifiers Linear Regression

**Problem 3:** Re-write the function gendat2.m into Python. Using the 100 points of training data in classasgntrain1.dat, write PYTHON code to train the coefficient matrix  $\hat{\beta}$ .

```
import sys
   import numpy as np
   import matplotlib.pyplot as plt
   def gendata2(class_type, N):
       m0 = np.array(
            [[-0.132, 0.320, 1.672, 2.230, 1.217, -0.819, 3.629, 0.8210, 1.808, \ 0.1700],
             [-0.711, -1.726, 0.139, 1.151, -0.373, -1.573, -0.243, -0.5220, -0.511, 0.5330]])
10
       m1 = np.array(
              [[-1.169, 0.813, -0.859, -0.608, -0.832, 2.015, 0.173, 1.432, 0.743, 1.0328],
11
12

**Problem 5:** Show that (2) is true. In particular, make sure you understand what is meant by up to a constant which does not depend on the class"

$$f_k(\boldsymbol{x}) = \frac{1}{(2\pi)^{d/2} |\hat{R}^{1/2}|} \exp[-\frac{1}{2} (\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)^T \hat{R}_k^{-1} (\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)]$$

Using Bayes rule, we can produce the following form. Note: When using Bayes Rule, constants exuding the random variable can be eliminated without affecting the results:

$$\hat{\pi}_k |\hat{R}_k|^{-1/2} \exp[-\frac{1}{2}(\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)^T \hat{R}_k^{-1}(\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)]$$

Now taking the log of the equation gives us:

$$\log \hat{\pi}_k - \frac{1}{2} \log |\hat{R}_k| - \frac{1}{2} (\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)^T \hat{R}_k^{-1} (\boldsymbol{x} - \hat{\boldsymbol{\mu}}_k)$$

#### Linear Logistic Regression

**Problem 8:** Using the probability model  $P(Y=0|X=x)=\frac{1}{1+\exp[-\beta^Tx]}$ , show that  $l(\beta)$  can be written as

$$l(\beta) = \sum_{i=1}^{N} y_i \beta^T \boldsymbol{x}_i - log(1 + e^{\beta^T \boldsymbol{x}_i})$$

Note:

$$\frac{e^{\beta^T \boldsymbol{x}_i}}{1 + e^{\beta^T \boldsymbol{x}_i}} = \frac{1}{1 + e^{-\beta^T \boldsymbol{x}_i}}$$

We begin with the equation:

$$\begin{split} l(\beta) &= \sum_{i=1}^{N} y_{i} \log p(\boldsymbol{x}_{i};\beta) + (1-y_{i}) \log(1-p(\boldsymbol{x}_{i};\beta)) \\ &= \sum_{i=1}^{N} y_{i} \log(\frac{1}{1+e^{-\beta^{T}\boldsymbol{x}_{i}}}) + (1-y_{i}) \log(1-\frac{1}{1+e^{-\beta^{T}\boldsymbol{x}_{i}}}) \\ &= \sum_{i=1}^{N} -y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) + (1-y_{i}) \log(\frac{1}{1+e^{-\beta^{T}\boldsymbol{x}_{i}}} - \frac{1}{1+e^{-\beta^{T}\boldsymbol{x}_{i}}}) \\ &= \sum_{i=1}^{N} -y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) + (1-y_{i}) \log(\frac{e^{-\beta^{T}\boldsymbol{x}_{i}}}{1+e^{-\beta^{T}\boldsymbol{x}_{i}}}) \\ &= \sum_{i=1}^{N} -y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) + (1-y_{i})(\log(e^{-\beta^{T}\boldsymbol{x}_{i}}) - \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}})) \\ &= \sum_{i=1}^{N} -y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) + (1-y_{i})(-\beta^{T}\boldsymbol{x}_{i} - \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}})) \\ &= \sum_{i=1}^{N} -y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) - \beta^{T}\boldsymbol{x}_{i} - \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) + y_{i}\beta^{T}\boldsymbol{x}_{i} + y_{i} \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) \\ &= \sum_{i=1}^{N} y_{i}\beta^{T}\boldsymbol{x}_{i} - \beta^{T}\boldsymbol{x}_{i} - \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}}) \\ &= \sum_{i=1}^{N} y_{i}\beta^{T}\boldsymbol{x}_{i} - (\beta^{T}\boldsymbol{x}_{i} + \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}})) \\ &= \sum_{i=1}^{N} y_{i}\beta^{T}\boldsymbol{x}_{i} - (\log(e^{\beta^{T}\boldsymbol{x}_{i}}) + \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}})) \\ &= \sum_{i=1}^{N} y_{i}\beta^{T}\boldsymbol{x}_{i} - \log(1+e^{\beta^{T}\boldsymbol{x}_{i}}) + \log(1+e^{-\beta^{T}\boldsymbol{x}_{i}})) \end{split}$$

**Problem 9:** Show that

$$\frac{\partial l(\beta)}{\partial \beta} = \sum_{i=1}^{N} \boldsymbol{x}_{i}(y_{i} - p(\boldsymbol{x}_{i}; \beta))$$

Starting with the equation from the previous problem.

$$\frac{\partial}{\partial \beta} \sum_{i=1}^{N} y_i \beta^T \boldsymbol{x}_i - \log(1 + e^{\beta^T \boldsymbol{x}_i})$$

$$\sum_{i=1}^{N} y_i \boldsymbol{x}_i - \frac{\partial}{\partial \beta} \log(1 + e^{\beta^T \boldsymbol{x}_i})$$

$$\sum_{i=1}^{N} y_i \boldsymbol{x}_i - \frac{\boldsymbol{x}_i e^{\beta^T \boldsymbol{x}_i}}{1 + e^{\beta^T \boldsymbol{x}_i}}$$

$$\sum_{i=1}^{N} y_i \boldsymbol{x}_i - \frac{\boldsymbol{x}_i e^{\beta^T \boldsymbol{x}_i}}{1 + e^{\beta^T \boldsymbol{x}_i}}$$

$$\sum_{i=1}^{N} y_i \boldsymbol{x}_i - \boldsymbol{x}_i p(\boldsymbol{x}_i; \beta)$$

$$\sum_{i=1}^{N} x_i (y_i - p(\boldsymbol{x}_i; \beta))$$

Problem 10: Show that

$$\frac{\partial^2 l(\beta)}{\partial \beta \partial \beta^T} = \sum_{i=1}^N \boldsymbol{x}_i \boldsymbol{x}_i^T p(\boldsymbol{x}_i; \beta) (1 - p(\boldsymbol{x}_i; \beta))$$

Beginning with the first derivative from the previous problem:

$$\frac{\partial}{\partial \beta} \sum_{i=1}^{N} \boldsymbol{x}_{i} (y_{i} - p(\boldsymbol{x}_{i}; \beta))$$

$$\sum_{i=1}^{N} -\frac{\partial}{\partial \beta} \boldsymbol{x}_{i} p(\boldsymbol{x}_{i}; \beta))$$

$$\sum_{i=1}^{N} -\boldsymbol{x}_{i} \frac{\partial}{\partial \beta} \frac{1}{1 + e^{\beta^{T} \boldsymbol{x}_{i}}}$$

$$\sum_{i=1}^{N} \frac{-\boldsymbol{x}_{i} e^{\beta^{T} \boldsymbol{x}_{i}} x^{T}}{(1 + e^{\beta^{T} \boldsymbol{x}_{i}})^{2}}$$

$$\sum_{i=1}^{N} \frac{-\boldsymbol{x}_{i} e^{\beta^{T} \boldsymbol{x}_{i}} x^{T}}{(1 + e^{\beta^{T} \boldsymbol{x}_{i}})^{2}}$$

Note:

$$1 - p(\boldsymbol{x}_i; \beta) = \frac{1 + e^{\beta^T \boldsymbol{x}_i}}{1 + e^{\beta^T \boldsymbol{x}_i}} - \frac{1}{1 + e^{\beta^T \boldsymbol{x}_i}}$$
$$= \frac{e^{\beta^T \boldsymbol{x}_i}}{1 + e^{\beta^T \boldsymbol{x}_i}}$$

So,

$$\sum_{i=1}^{N} \frac{-\boldsymbol{x}_i e^{\beta^T \boldsymbol{x}_i} x^T}{(1 + e^{\beta^T \boldsymbol{x}_i})^2} = \frac{-\boldsymbol{x}_i^T \boldsymbol{x} (1 - p(\boldsymbol{x}_i; \beta))}{1 + e^{\beta^T \boldsymbol{x}_i}}$$
$$= -\boldsymbol{x}_i^T \boldsymbol{x} \ p(\boldsymbol{x}_i; \beta) (1 - p(\boldsymbol{x}_i; \beta))$$
